```
The invention relates to a novel nucleic acid encoding a polypeptide comprising amino acid residues 27-309 of a 473 amino acid sequence (Pl. human Nogo receptor (NgR) NTLRRCT domain), or residues 27-309 of Pl with 1-20 conservative amino acid substitutions, and less than a complete CTS domain, provided that a partial CTS domain, if present, consists of no more than the first 39 consecutive residues. The nucleic acid of the invention has neuroprotective acid is useful for decreasing inhibition of axonal growth by a central nervous system (CNS) neuron. The MgR polyapetide or an agent inhibits the binding of Nogo to NgR of Olypeptide or an agent inhibits the binding of Nogo to NgR of Olypeptide or an agent inhibits the binding of Nogo to NgR of Olypeptide or an agent inhibits the binding of Nogo to NgR or NgR poinal cord injury. Expression of an NgR protein may be associated with inhibition of axonal regeneration following cranial, cerebral or spinal trauma, stroke or a demyelinating disease, such as multiple sclerosis, monophasic demyelination, encephalopathy, panencephalopathy, panencephalopathis, or Krabbe's disease. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 75 BP; 25 A; 15 C; 18 G; 17 T; 0 U; 0 Other;

                                    The present invention describes a human stress-phosphorylated endoplasmic reticulum protein, designated Nogo B. Nogo B has cytostatic activity and is a modulator of the storage and exchange of calcium, cell growth and cellular stress response. It can: regulate oxidative stress; inhibit neurite outgrowth, neuron growth and axon regeneration. Nogo B polypeptides and polymocleotides are useful for modulating stress levels and cellular stress-response, cell growth and viability, diagnosis and treatment of cancer, malignant growth and other Nogo B related diseases. Nogo B polypeptides are also useful to screen combinatorial libraries to identify agonist or antagonist. Antibodies against Nogo B polypeptides are useful for affinity chromatography and distinguishing Nogo B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Nogo receptor; NgR; CTS domain; neuroprotective; gene therapy; axonal growth; central nervous system; CNS; Nogo; spinal cord injury; carnial trauma; serioke; Krabbe's disease; demyelinating disease; multiple sclerosis; monophasic demyelination; encephalomyelitis; multifocal leukoencephalopathy; panencephalitis; gene;
                                                                                                                                                                                                                                                                                        polypeptides. The present sequence represents a human Nogo B phosphorothioate antisense oligonucleotide from the present invention

                                                         The invention relates to a novel nucleic acid encoding a polypeptide comprising amino acid residues 27-309 of a 473 amino acid sequence (Pl, human Nogo receptor (NgR) NTLRRCT domain), or residues 27-309 of Pl with 1-20 conservative amino acid substitutions, and less than a complete CTS domain, provided that a partial CTS domain, if present, consists of no main, provided that a partial CTS domain, if present, consists of no more than the first 13 consecutive residues. The nucleic acid of the invention has neuroprotective activity. The polymucleotide may have a use in gene therapy. The nucleic acid is useful for decreasing inhibition of axonal growth by a central nervous system (CNS) neuron. The NgR polypeptide or an agent inhibite the binding of Nogo to NgR or NgR polypeptide or an agent inhibite the binding of Nogo to NgR or NgR polyal in treating central nervous system disease, disorder or injury, e.g. spinal cord injury. Expression of an NgR protein may be associated with inhibition of axonal regeneration following cranial, cerebral or spinal cord injury, encephalopathy, panencephalitis, or Krabbe's disease. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a novel nucleic acid encoding a polypeptide comprising amino acid residues 27-309 of a 473 amino acid sequence (Pl, human Nogo receptor (NGR) NTLRRCT domain), or residues 27-309 of Pl with 1-20 conservative amino acid substitutions, and less than a complete CTS domain, provided that a partial CTS domain, if present, consists of no convertion has neuroprotective acidity. The polynucleotide may have a use in gene therapy. The nucleic acid is useful for decreasing inhibition of axonal growth by a central nervous system (CNS) neuron. The NGR polypeptide or an agent inhibite the binding of Nogo to NGR or NGR dependent signal transduction in the central nervous system neuron may be used in treating central nervous system disease, disorder or injury, e.g. spinal cord injury. Expression of an NGR protein may be associated with thibition of axonal responsability and provided or an injury, e.g. inhibition of axonal responsability or injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, Nogo receptor, NgR; CTS domain, neuroprotective; gene therapy; axonal growth; central nervous system; CNS; Nogo; spinal cord injury; cranial trauma; spinal trauma; spinal trauma; stroke; Krabbe; Kabbes; desese; demyelinating disease; multiple sclerosis; monophasic demyelination; encephalomyelitis; multifocal leukoencephalopathy; panencephalitis; gene;

The invention relates to a novel nucleic acid encoding a polypeptide comprising amino acid residues 27-309 of a 473 amino acid sequence (Pl, human Nogo receptor (NgR) NTRRCT domain), or residues 27-309 of Pl with 1-20 conservative amino acid substitutions, and less than a complete CTS domain, provided that a partial CTS domain, if present, consists of no more than the first 39 consecutive residues. The nucleic acid of the invention has neuroprotective activity. The polynucleotide may have a use in gene therapy. The nucleic acid is useful for decreasing inhibition of axonal growth by a central nervous system (CNS) neuron. The NgR polypeptide or an agent inhibite the binding of Nogo to NgR or NgR-capedient signal transduction in the central nervous system neuron may be used in treating central nervous system disease, disorder or injury, e.g. spinal cord injury. Expression of an NgR protein may be associated with inhibition of axonal regeneration following cranial, cerebral or spinal trauma, stroke or a demyelinating disease, such as multiple sclerosis, monophalatic demyelination, encephalomyelitis, multifocal material mat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         leukbencephalopathy, panencephalitis, or Krabbe's disease. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                  New human Nogo receptor polypeptides and nucleic acids, useful for decreasing inhibition of axonal growth by a central nervous system neuron, or in treating central nervous system disease, disorder or injury, e.g. spinal cord injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 9; Length 120;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel nucleic acid encoding a polypeptide comprising amino acid residues 27-309 of a 473 amino acid sequence (PI, human Nogo receptor (NgR) WITART domain), or residues 27-309 of PI with 1-20 conservative amino acid substitutions, and less than a complete CTS domain, provided that a partial CTS domain, if present, consists of no more than the first 39 consecutive residues. The nucleic acid of the invention has neuroprotective activity. The polymucleotide may have a use in gene therapy. The nucleic acid is useful for decreasing inhibition of axonal growth by a central nervous system (CNS) neuron. The NgR capendent signal transduction in the central nervous system neuron may be cused in treating central nervous system disease, disorder or injury, e.g. spinal cord injury. Expression of an NgR protein may be associated with containing cancer and demyelinating disease, such as multiple sclerosis, monophasic demyelination, encephalomyelitis, multifocal leukoencephalogathy, panencephalitis, or Krabbe's disease. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a novel nucleic acid encoding a polypeptide comprising amino acid residues 27-309 of a 473 amino acid sequence (PI, human Mogo receptor (MR) NTLERCT domain), or residues 27-309 of PI with 1-20 conservative amino acid substitutions, and less than a complete CTS domain, provided that a partial CTS domain, if present, consists of no more than the first 39 consecutive residues. The nucleic acid of the invention has neuroprotective activity. The polynucleotide may have a use in gene therapy. The nucleic acid is useful for decreasing inhibition of axonal growth by a central nervous system (CNS) neuron. The NgR polypeptide or an agent inhibits the binding of Nogo to NgR or NgR copypeptide or an agent inhibits the binding of Nogo to NgR or NgR copypendent signal transduction in the central nervous system neuron may be used in treating central nervous system disease, disorder or injury, e.g. spinal cord injury. Expression of an NgR protein may be associated with inhibition of axonal regeneration following cranial, carebral or spinal trauma, stroke or a demyelinating disease, such as multiple sclerosis, purposite demyelinating disease, such as multiple sclerosis, purpositive demonphasic demyelination, encephalomyelitis, multifocal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                leukoencephalopathy, panencephalitis, or Krabbe's disease. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nogo-66; MAG; myelin protein; Nogo; glycoprotein; tenascin-R; TN-R; TNR-EGFL; myelin-associated glycoprotein; neural growth; central nervous system damage; NS damage; spinal cord injury; stroke; vaccine; myelin antigen; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human Nogo receptor polypeptides and nucleic acids, useful for decreasing inhibition of axonal growth by a central nervous system neuron, or in treating central nervous system disease, disorder or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel nucleic acid encoding a polypeptide comprising amino acid residues 27-309 of a 473 amino acid sequence (Pl, human Nogo receptor (NgR) NTLRCT domain), or residues 27-309 of Pl with 1-20 conservative amino acid substitutions, and less than a complete CTS domain, provided that a partial CTS domain, if present, consists of no more than the first 39 consecutive residues. The nucleic acid of the invention has neuroprotective activity. The Polymuclacotide may have a use in gene therapy. The nucleic acid is useful for decreasing inhibition of axonal growth by a central nervous system (CNS) neuron. The NgR polypeptide or an agent inhibits the binding of Nogo to NgR or NgP dependent signal transduction in the central nervous system neuron may be used in tracting central nervous system disease, disorder or injury, e.g. spinal cord injury. Expression of an NgR protein may be associated with inhibition of axonal regeneration following cranial, cerebral or spinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Nogo receptor; NgR; CTS domain; neuroprotective; gene therapy; axonal growth; central nervous system; CNS; Nogo; spinal cord injury; cranial trauma; serebral trauma; spinal trauma; stroke; skrabbe, strabes; demyelinating disease; multiple sclerosis; monophasic demyelination; encephalomyelitis; multifocal leukoencephalopathy; panencephalitis; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              trauma, stroke or a demyelinating disease, such as multiple sclerosis, monophasic demyelination, encephalomyelitis, multifocal leukoencephalopathy, panencephalitis, or Krabbe's disease. The present sequence is used in the exemplification of the invention

```
derivative comprising a mutation in or flanking MAG ig-like domain 5 (1945), excluding the MAG derivative MAG (dl-3)-FC, where the mutation reduces or eliminates the ability of the derivative to regulate neurite outgrowth as compared to endogenous or soluble MAG without eliminating binding to neuronal surfaces. The inhibitors of MAG are useful for promoting neural growth and regeneration. They are also useful for treating neural growth and regeneration. They are also useful for treating neural degeneration associated with injuries, disorders, or diseases. The disorder, disease, or condition is associated with expected with amylotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease, Huntington's disease, multiple sclerosis, Creutzfeldt-Jacob disease, Huntington's disease, multiple sclerosis, Creutzfeldt-Jacob disease, kuntington's disease), or progressive supranuclear palsy. The present sequence represents the human NOGO-66 CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NSPLP; neuroendocrine-specific protein-like protein; human; gene therapy; neurodegenerative disease; amyotrophic lateral sclerosis; cancer; ss.
                                                                                                                                                                                                                                                                                                                            New myelin-associated glycoprotein (MAG) derivative comprises a mutation in or flanking MAG Ig-like domain 5 (Igd5), excluding the MAG derivative MAG (dl-3)-Fc, useful promoting neural growth and regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a myelin-associated glycoprotein (MAG)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                            New peptides that interact with myelin proteins Nogo, TNR and MAG, useful
in preparing a composition for treating CNS damage, spinal cord injury or
stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              describes perides which interact with the myelin proteins Nogor (specifically the Nogo-66 domain), the extracellular matrix glycoprotein tenascin-R (TN-R) (specifically TN-R epidermal growth factor like (TNR-BGFL) and myelin-associated glycoprotein (MAG). These proteins have phage display library exposed to a plate coated with the target protein. Peptides of the invention are useful in preparing a composition for treating central nervous system (CNS) damage, spinal cord injury or antigens. The peptides may also be used in vaccines against myelin antigens. The vaccine is based on the specific inhibitory portions of major myelin proteins, instead of the whole protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                      This sequence encodes a human neuroendocrine-specific protein-like protein (NSPLP) of the invention. Recombinant cells transformed with the DNA are used to express the NSPLP proteins, which are used to treat cancer and neurodegenerative diseases such as amyotrophic lateral sclerosis. Also antisense nucleic acids and antagonists of NSPLP can bused to inhibit activity of the NSPLP proteins. Antibodies specific for NSPLP are used for diagnosis and monitoring treatment of diseases associated with NSPLP expression, in usual immunoassays, and to isolate NSPLP from natural sources. The NSPLP proteins, or their fragments can also be used in drug screening to identify NSPLP antagonists. The mucleic acid can be used diagnostically and for monitoring treatment (in

human secreted proteins, and encode the proteins given in AAX12261 to human secreted proteins, and encode the proteins given in AAX12261 to AAX12314, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proliferation/differentiation activity, heamatopolesis regulating activity, chemoteration activity, heamatopolesis regulating activity, chemoteratical cartivity, nemeratoration/differentiation activity, nemeratoration activity, anti-inflammatory activity, tumour inhibition activity or other activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products activity, respector/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products is can also be used for obtaining corresponding procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for almost in a proper activity is a polypeptide on the insertion of a content of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOGO-C; human; chromosome 2p21; neuropathy; spinal injury; brain injury; stroke; neuronal degeneration; Alzheimer's disease; Parkinson's disease; neuromuscular disorder; psychiatric disorder; developmental disorder;

AAB82348). NOGO-C is a novel splice variant of the human NOGO gene on chromosome 2p21. 2 Other splice variants, NOGO-A and NOGO-B, have previously been identified. The invention provides NOGO-C polypeptides and polymucleotides, and methods for producing such polypeptides by recombinant techniques. Also disclosed are methods for utilising NOGO-C polypeptides and polymerleotides in the treatment of diseases including neuropathies, spinal injury, brain injury, stroke, neuronal degeneration, for example Alzhaimer's disease and Parkinson's disease, neuromuscular disorders, psychiatric disorders and developmental disorders. Also provided are methods for identifying agonists and agonists for use in treating conditions associated with NOGO-C imbalance, and dispnostic assays for detecting diseases associated with inappropriate NOGO-C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 600 BP; 161 A; 113 C; 144 G; 182 T; 0 U; 0 Other;

(GENE-) GENE LOGIC INC

Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in a liver tissue sample. WPI; 2002-426119/45.

Claim 1; SEQ ID NO 3485; 298pp; English

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a cytostatic ample. The method of the invention has hepatocropic, and cytostatic ample. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug efficacy and drug metabolism. Note: The sequence data

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing cardiovascular disorders such as myocardial ischaemias; (d) wound healing (c) cardiovascular diseases e.g. cerebral anoxia and epilepsy; and (f) infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAL Plate: 4 Row: c Column: 8
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 5902015
This clone has the following problem: The cds is short compared to the longest cds in the locus.
                                                                                                                                                                                                                                                                                                                                                                             Contact: nisc_mgc@nhgri.nih.gov

/note="Vector: pUChi; Site 1: Sfil-A; Site 2: Sfil-B; The
library was prepared using the SMART cDNA library
construction Kit. (Clontech), doing only primer extension,
but not PCR amplification of the cDNA. The only deviation
from the published protocoll was that we cloned the cDNA
into a plasmid Vector."

/note="Vector: Lambda Zap Express; Site_1: ECORI; Site_2:
XhoI; Myeloma cells from multiple myeloma patients' bone
marrow were purified by magnetic cell sorting. mRNA were
purified and an oligo d(v]18 primer containing XhoI
restriction site was used to prime first strand synthesis
using M-MNU reverse transcriptase. To protect the CDNAs
from XhoI digestion in subsequent cloning step, the
nucleotide analogue 5-methyl-dCTP was added to the
nucleotide mixture and [a-32P]dATP was added to monitor
the quantity and quality of first strand synthesis. After
second-strand synthesis and blunting of cDNA termini,
ECORI adapters were ligated, followed by kinase treatment
and digestion with XhoI. The CDNAs were then
size-fractionated using Sephacryl 5-500 column and then
ligated into ECORI and XhoI digested Lambda Zap Express
vector. The ligation product was packaged using digapack
II packaging extract. The library had primary library
andomly selected for single pass sequencing."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /tissue_type="embryonic stem cell, retinoic acid and minogen-treated hBS cell line H7" /clone lib="GRW PRENEG" /note="oligo dT_primed, full-length enriched cDNA library from hBS cell line H7 (p29) maintenined in feeder-free conditions. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        JOURNAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            COMMENT
```

```
NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu

SOURCE INFORMATION

g

The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa and Minako Tateno in the laboratory of Pieter de Jong (http://www.chori.org) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.resgen.com) or

This sequence is the entire insert of the clone. Location/Qualifiers NEIGHBORING SEQUENCE INFORMATION:

* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Contact: sequence_submissions@genome.wi.mit.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation annotation and not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSRROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at from a Sebrafiab BAC library verwor. Traincent.

Conserved TA repeats. Where this is found the longest good quality
representation will be submitted.
Repeat names beginning 'Dr' were identified by the Recon repeat
discovery system (Zhirong Bao and Sean Eddy, submitted), and those
beginning 'drr' were identified by Rick Waterman (Stephen Johnson
lab, WashU). For further information see
